COMPLETE ARCHITECTURE GUIDE

15 Core Components of Agentic AI System

Build production-ready agentic systems that solve real failure modes.

Memory | Planning | Execution | Safety | Monitoring

CORE COMPONENT

Memory (Short-Term + Long-Term)

Stores conversational context and remembers user preferences. Enables consistency across sessions.

WHY IT MATTERS

Without memory, agents repeat mistakes. Stateless agents feel smart but dumb.

- Short-term: Current conversation and active task context
- Long-term: User preferences, past outcomes, learned constraints

FAILURE WITHOUT IT

Re-asking the same questions. Inconsistent behavior across sessions.

Repost

CORE COMPONENT

Knowledge Base (KB)

Structured source of truth. Externalized facts, not model guesses. Where truth comes from.

INCLUDES

Documents, databases, knowledge graphs, vector stores.

- LLMs are probabilistic
- KBs are deterministic
- Grounds outputs in facts

FAILURE WITHOUT IT

Hallucinations increase. Outputs cannot be trusted.

Repost

CORE COMPONENT

Tool Use & API Integration

Ability to take real-world actions. Production agents must do, not just say.

- Booking flights
- Sending emails
- Querying APIs
- Updating systems

HIDDEN RISK

Tool failures, rate limits, partial success. This leads to execution loops.

KEY INSIGHT

Answers don't equal outcomes. Actions matter more than words.

Repost

CORE COMPONENT

Planning & Decomposition Engine

Breaks high-level goals into smaller steps. Systems need structured execution.

EXAMPLE

"Build a website" becomes: Gather requirements, design UI, write code, test, deploy.

- LLMs are good at reasoning
- Systems need structured execution
- Prevents random jumping

FAILURE WITHOUT IT

Agents jump randomly. No predictable behavior.

Repost

CORE COMPONENT

Execution Loop

Repeatedly runs plan → act → observe → adjust. Agents must assume things will fail.

- Retry logic
- Backoff strategies
- Termination conditions

CRITICAL INSIGHT

Agents must assume things will fail. One failure shouldn't mean total failure.

FAILURE WITHOUT IT

One failure equals total failure. No recovery mechanism.

06

Repost

CORE COMPONENT

Reasoning & Decision Making

Chooses the next best action. Based on current state, memory, and environment signals.

- Multiple paths exist
- Agents must choose intelligently
- Action selection under constraints

> **KEY POINT**
>
> Reasoning is not just chain-of-thought. It's action selection under constraints.

07

Repost

CORE COMPONENT

Natural Language Interface (LLM)

The interface layer. NOT the system itself. The LLM is the brain's voice, not the whole body.

- Understanding intent
- Generating responses
- Translating goals into actions

> **IMPORTANT REFRAMING**
>
> The LLM is the brain's voice, not the whole body. Over-reliance causes prompt spaghetti.

08

Repost

CORE COMPONENT

Goal Definition & Tracking

Explicit representation of success. Text output doesn't equal goal completion.

- KPI reached
- Task completed
- Error rate below threshold

KEY SHIFT

From "Did it respond?" To "Did it achieve the outcome?"

09

Repost

CORE COMPONENT

Guardrails & Safety Filters

Constraints on agent behavior. Autonomy increases risk. Safety must scale with power.

- Content safety
- Action safety
- Ethical boundaries

KEY IDEA

Autonomy without constraints is liability. Production systems need safety layers.

Repost

CORE COMPONENT

Logging & Feedback Loop

Full trace of decisions and actions. What happened when it failed?

- Inputs and outputs
- Tool calls
- Failures and retries

WHY IT MATTERS

Debugging, auditing, learning from failure. Production question: What happened when it failed?

Naved Khan

Senior Gen-AI Engineer

Repost

CORE COMPONENT

Evaluation & Testing Frameworks

Measuring correctness and reliability. If you can't measure it, you can't trust it.

- Accuracy over time
- Success rate
- Regression tests

WHY IT MATTERS

Agents degrade silently. Changes have side effects. Measurement prevents surprises.

Repost

CORE COMPONENT

Multi-Agent Collaboration

Multiple agents with specific roles. Multi-agent systems come after the core loop works.

- Research agent
- Writer agent
- QA agent

> **IMPORTANT RULE**
>
> Multi-agent systems come after the core loop works. Without a solid base, complexity explodes.

Repost

CORE COMPONENT

Observability & Real-Time Monitoring

Real-time visibility into system health. Metrics, traces, and performance tracking.

- Performance metrics
- Latency tracking
- Error rates
- Resource usage

CRITICAL INSIGHT

Logging shows what happened. Observability shows what's happening now. You can't fix what you can't see.

FAILURE WITHOUT IT

Issues go unnoticed. Performance degrades silently. Debugging becomes guesswork.

Repost

CORE COMPONENT

State Management & Context Flow

Manages execution state across steps. Tracks context transitions. Maintains session continuity.

- State machines
- Context propagation
- Session management
- State persistence

KEY POINT

State management is different from memory. Memory stores information. State management tracks where you are.

FAILURE WITHOUT IT

Lost context between steps. Unclear execution progress. Hard to resume interrupted tasks.

Repost

CORE COMPONENT

Resource Management & Optimization

Optimizes compute and memory usage. Manages costs and rate limits. Balances performance and efficiency.

- Cost tracking
- Rate limit handling
- Caching strategies
- Batch processing

KEY INSIGHT

Production systems must be efficient, not just functional. LLM calls are expensive.

FAILURE WITHOUT IT

Costs spiral out of control. Rate limits cause failures. Slow performance frustrates users.
